## MEMORANDUM

TO: Pacific Flyway Council and Study Committee

FROM: Todd A. Sanders, Pacific Flyway Representative

DATE: July 18, 2014

SUBJECT: 2014 Pacific Flyway Data Book

The following briefing material has been assembled for use by State and U. S. Fish and Wildlife Service personnel in formulating recommendations for the 2014-2015 waterfowl hunting seasons in the Pacific Flyway. This collection of harvest, population, and hunter data can also serve as a desk-top reference for providing responses to inquiries from agency personnel, the media, and public. These data represent an extraordinary collaborative effort by many individuals from State, Federal, and other organizations. Thank you to all cooperators who have contributed toward this significant effort.

Harvest and hunter participation estimates for 2013/2014 are preliminary. Final estimates from the HIP survey are only available through 2003 at present.

Sincerely,

Todd A. Sanders  
Pacific Flyway Representative

\* Examination Rate = Swans examined/Tundra Swan Harvest Estimate

\*\*Trumpeter Swans Detected: Ad. w/o yellow lore and posterior nare to bill tip > or + 62mm, Juv. w/o yellow lore and posterior nare to bill tip > or = 61mm.

\*\*\*In 1996, 6 of the 7 Trumpeter swans detected in Utah's harvest were swans marked and Tran located from Idaho and released in Utah as part of a research project; the other was a marked swan that was Tran located from Idaho to Oregon 2 years earlier.

Data in this table was provided by Blair Stringham, Utah Division of Wildlife Resources.

Laurel, MD 20708

Administrative Report—July 2, 2014

This report summarizes information about the status of duck populations and wetland habitats during spring 2014, focusing on areas encompassed by the U.S. Fish & Wildlife (USFWS) and Canadian Wildlife Services' (CWS) Waterfowl Breeding Population and Habitat Survey (WBPHS). This report does not include information from surveys conducted by state or provincial agencies.

In the traditional survey area, which includes strata 1–18, 20–50, and 75–77 (Figure 1), the total duck population estimate (excluding scoters [*Melanitta* spp.], eiders [*Somateria* spp. and *Polysticta stelleri*], long-tailed ducks [*Clangula hyemalis*], mergansers [*Mergus* spp. and *Lophodytes cucullatus*], and wood ducks [*Aix sponsa*]) was  $49.2 \pm 0.8$  [SE] million birds (Figure 3, Appendix A). This represents an 8% increase over last year's estimate of  $45.6 \pm 0.7$  million, and is 43% higher than the long-term average<sup>a</sup> (1955–2013; Table 1). Estimated mallard (*Anas platyrhynchos*) abundance was  $10.9 \pm 0.3$  million, which was similar to the 2013 estimate, and 42% above the long-term average of  $7.7 \pm 0.04$  million (Table 2). Estimated abundance of gadwall (*A. strepera*;  $3.8 \pm 0.2$  million) was similar to the 2013 estimate and 102% above the long-term average ( $1.9 \pm 0.02$  million; Table 3). The estimate for American wigeon (*A. americana*;  $3.1 \pm 0.2$  million) was 18% above the 2013 estimate of  $2.6 \pm 0.2$  million and 20% above the long-term average of  $2.6 \pm 0.02$  million (Table 4). The estimated abundance of green-winged teal (*A. crecca*) was  $3.4 \pm 0.2$  million, which was similar to the 2013 estimate and 69% above the long-term average ( $2.0 \pm 0.02$  million; Table 5). The estimate for blue-winged teal (*A. discors*;  $8.5 \pm 0.5$  million) was similar to the 2013 estimate and 75% above the long-term average of  $4.9 \pm 0.04$  million (Table 6). Estimates of northern shovelers (*A. clypeata*;  $5.3 \pm 0.3$  million) and northern pintails (*A. acuta*;  $3.2 \pm 0.2$  million) were similar to the 2013 estimates and were 114% above and 20% below their long-term averages of  $2.5 \pm 0.02$  million (Table 7) and  $4.0 \pm 0.04$  million (Table 8), respectively. Abundance estimates for redheads (*Aythya americana*;  $1.3 \pm 0.1$  million) and canvasbacks (*Aythya valisineria*;  $0.7 \pm 0.05$  million) were similar to their 2013 estimates and were 85% and 18% above their long-term averages of  $0.7 \pm 0.01$  million (Table 9) and  $0.6 \pm 0.01$  million (Table 10), respectively. Estimated abundance of scaup (*A. affinis* and *A. marila* combined;  $4.6 \pm 0.3$  million) was similar to the 2013 estimate and similar to the long-term average of  $5.0 \pm 0.05$  million (Table 11).

Spring was delayed even later than last year across most of the survey area. Habitat conditions during the survey were mostly improved or similar to last year, due to average to above-average annual precipitation. The exceptions were west-central Alberta and east of James Bay in Quebec (Figure 4). Alaska was the only region that experienced an early spring. The total pond estimate (Prairie Canada and U.S. combined) was  $7.2 \pm 0.2$  million which was similar to the 2013 estimate of  $6.9 \pm 0.2$  million and 40% above the long-term average of  $5.1 \pm 0.03$  million (Table 12, Figure 2).

In the traditional survey area, the majority of the Canadian prairies had below to well-below-average winter temperatures and average precipitation. Southern Manitoba benefitted from last year's summer and

Cover art derived from a photo by Mark Hoffman.

<sup>a</sup>Populations are considered to have changed from the previous year or long-term average if the observed significance value associated with change is  $\leq 0.10$ . Actual *P*-values are presented in tables.

fall precipitation, whereas southern Saskatchewan and most of Alberta were aided by spring 2014 precipitation. The 2014 estimate of ponds in Prairie Canada was  $4.6 \pm 0.2$  million. This estimate was similar to the 2013 estimate ( $4.6 \pm 0.2$  million) and 33% above the 1961–2013 average ( $3.5 \pm 0.03$  million). The Parklands remained in good condition from previous years' carry-over water and the boreal region has benefitted from above-average annual precipitation. Most of the Canadian portion of the traditional survey area was rated as good or excellent this year and the region continued to receive additional precipitation after the survey.

Much of the U.S. prairies had average winter precipitation and well-below-average winter temperatures that continued into spring. Habitat conditions improved in the western Dakotas and Montana from 2013 but remained similar in the eastern Dakotas. The 2014 pond estimate for the northcentral U.S. was  $2.6 \pm 0.1$  million which was similar to the 2013 estimate ( $2.3 \pm 0.1$  million) and 53% above the 1974–2013 average ( $1.7 \pm 0.02$  million). Waterfowl habitat in North Dakota remains under pressure from wetland drainage, loss of CRP grasses, and energy development.

In 2005, the USFWS and CWS began to integrate data from two previously independent waterfowl surveys conducted in eastern North America into a single composite estimate using hierarchical models. Consequently, total indicated bird definitions for American black ducks (*Anas rubripes*) were modified to provide a common index across surveys, and adjustments were made to the geographic stratification of the eastern survey area. Additional refinements to analytical methods are incorporated in the estimates presented in this report. For these reasons, population estimates presented in this report for the eastern survey area (Figure 1; Table 13) are not directly comparable with estimates presented in reports issued prior to 2006. Specifically, estimates are presented for only a portion of the eastern survey area and include data from strata 51, 52, 63, 64, 66–68, and 70–72. These 10 strata were chosen for presentation because at least one survey (i.e., either the CWS or USFWS survey) was conducted for each of these strata for the full period of record of the eastern survey (1990–2014). In cases where the USFWS has traditionally not recorded observations to the species level, composite estimates are provided only for multiple-species groupings (i.e., mergansers and goldeneyes [*Bucephala clangula* and *B. islandica*]). The CWS and USFWS agreed to use the hierarchical modeling approach for all species in the east. Currently, the models perform well for the six most common species. In previous years, we used design-based estimates and an overall mean across the two surveys, weighted by their precision, to derive integrated annual population indices for the less common American wigeon, scaup, bufflehead (*B. albeola*), and scoters until the hierarchical models could adequately accommodate the data for these species. These estimates have been discontinued because of concerns about (1) the appropriateness of weighting estimates from these surveys by precision, and (2) whether estimates for some species should be integrated given the data quality and coverage in the eastern survey. Nonetheless, the USFWS will continue to explore methods for deriving integrated estimates for some of the less common species in the eastern survey area. Analytical methods applied to eastern survey area data and results will be presented in greater detail in the 2014 Waterfowl Status Report.

Estimated abundance of American black ducks in the eastern survey area was  $0.6 \pm 0.04$  million which was similar to last year and the 1990–2013 average. The estimated abundance of mallards was  $0.4 \pm 0.1$  million, which was similar to the 2013 estimate and the 1990–2013 average. Abundance estimates of green-winged teal ( $0.2 \pm 0.04$  million) and ring-necked ducks ( $0.5 \pm 0.1$  million) were 19% and 22% below their 2013 estimates, and similar to their 1990–2013 averages, respectively. Abundance estimates for goldeneyes and mergansers were similar to last year's estimates and their 1990–2013 averages (Table 13, Figure 6, Appendix B).

Winter and spring temperatures in the eastern survey area were also well below normal with most areas receiving average to above-average precipitation. Habitat conditions were similar to 2013 or improved, particularly in the northeastern United States. An exception was the area east of James Bay in Quebec which has experienced dry conditions and extensive wildfires. Less flooding was noted across the eastern survey area, in contrast to some years, and continued cool, damp spring conditions in the Maritimes could limit waterfowl production.

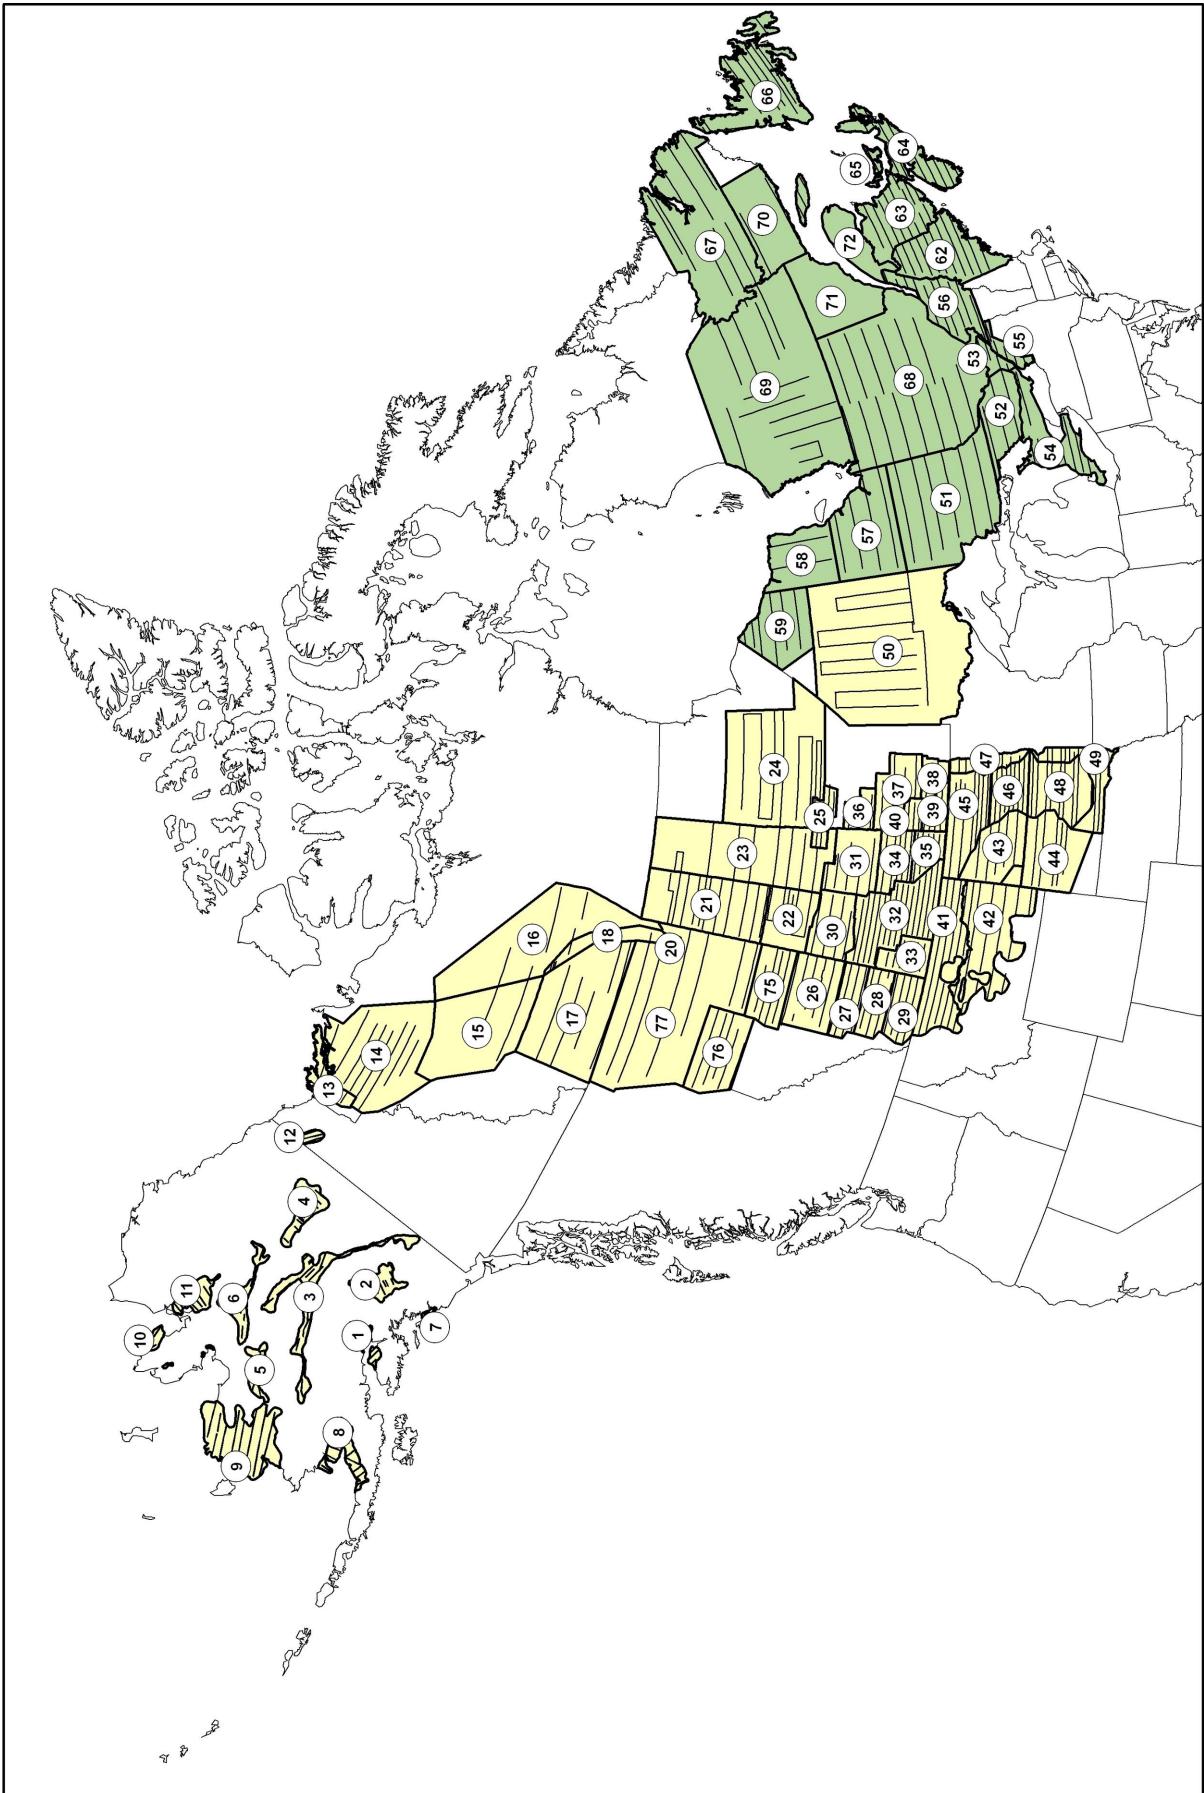

Figure 1. Strata and transects of the Waterfowl Breeding Population and Habitat Survey (yellow = traditional survey area, green = eastern survey area).

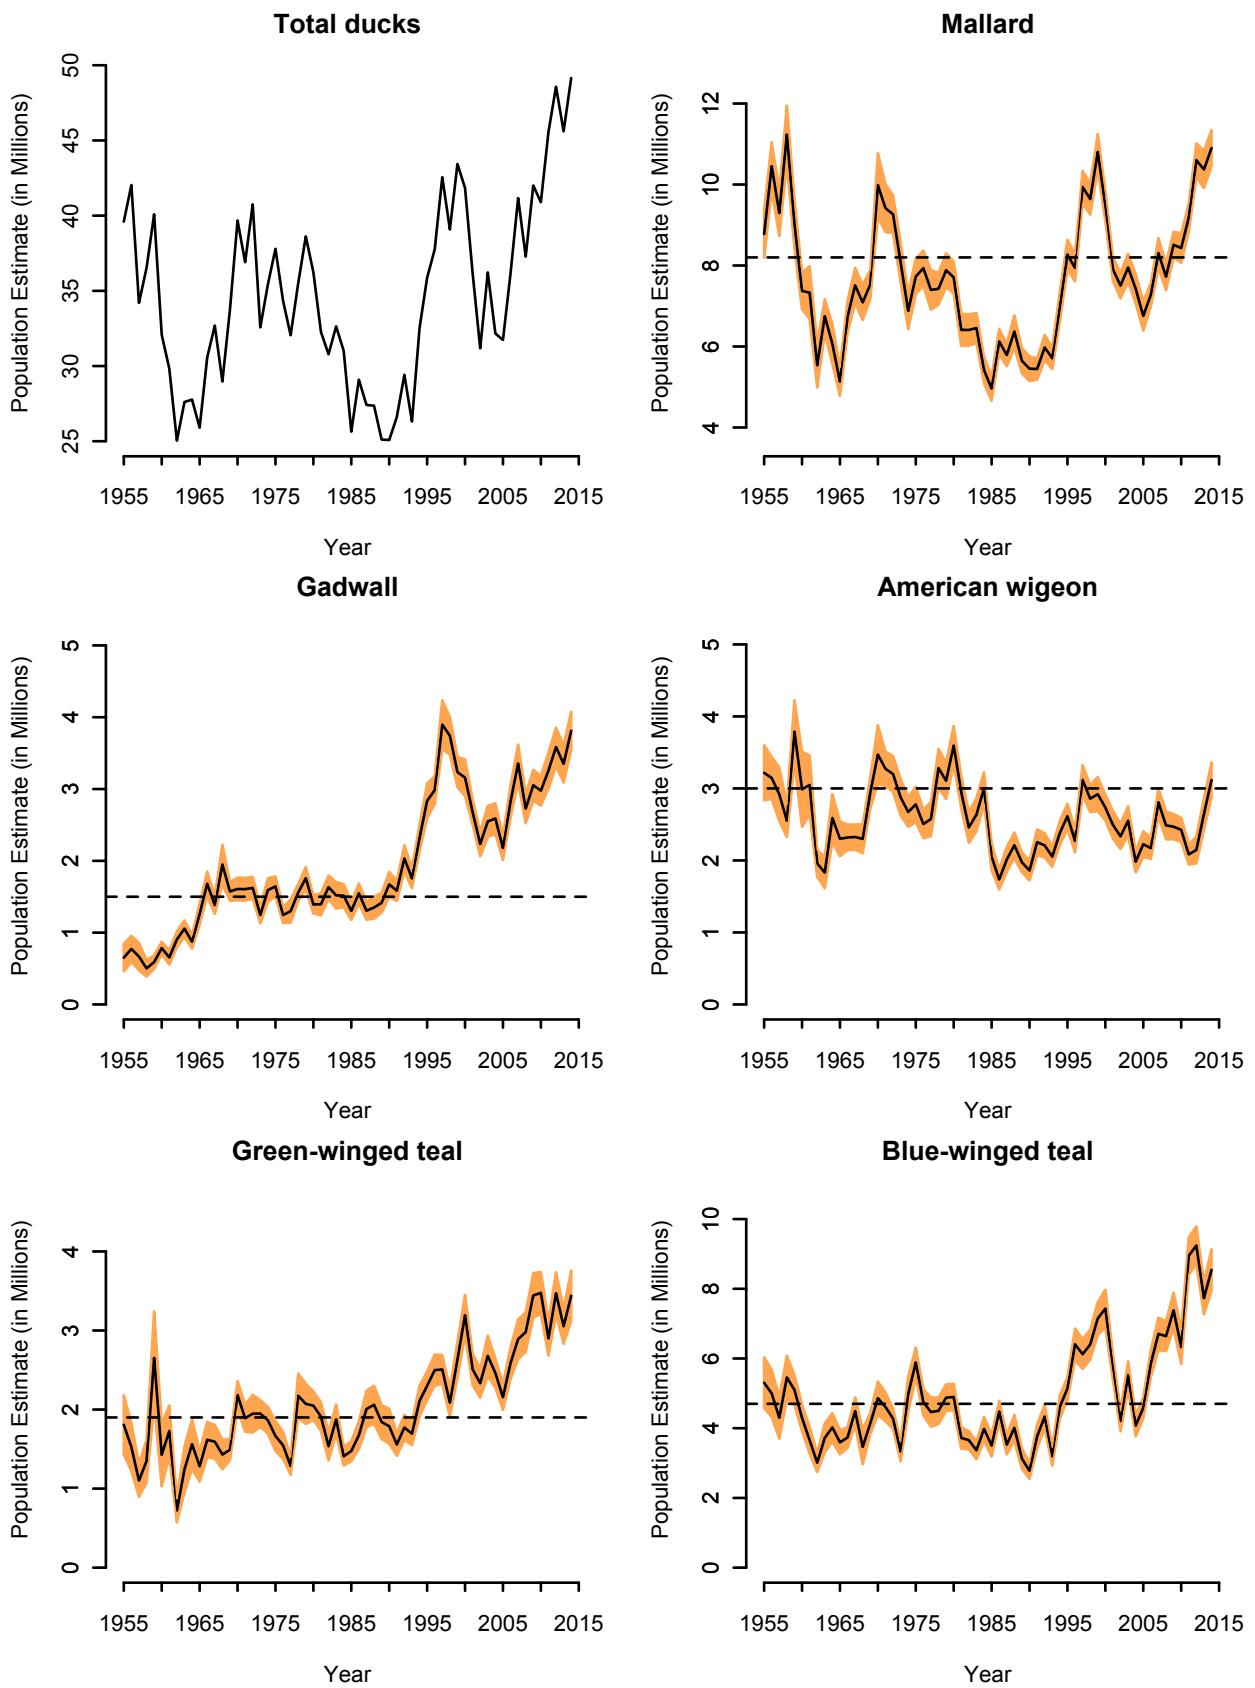

Figure 3. Breeding population estimates, 90% confidence intervals, and North American Waterfowl Management Plan population goal (dashed line) for selected species in the traditional survey area (strata 1–18, 20–50, 75–77).

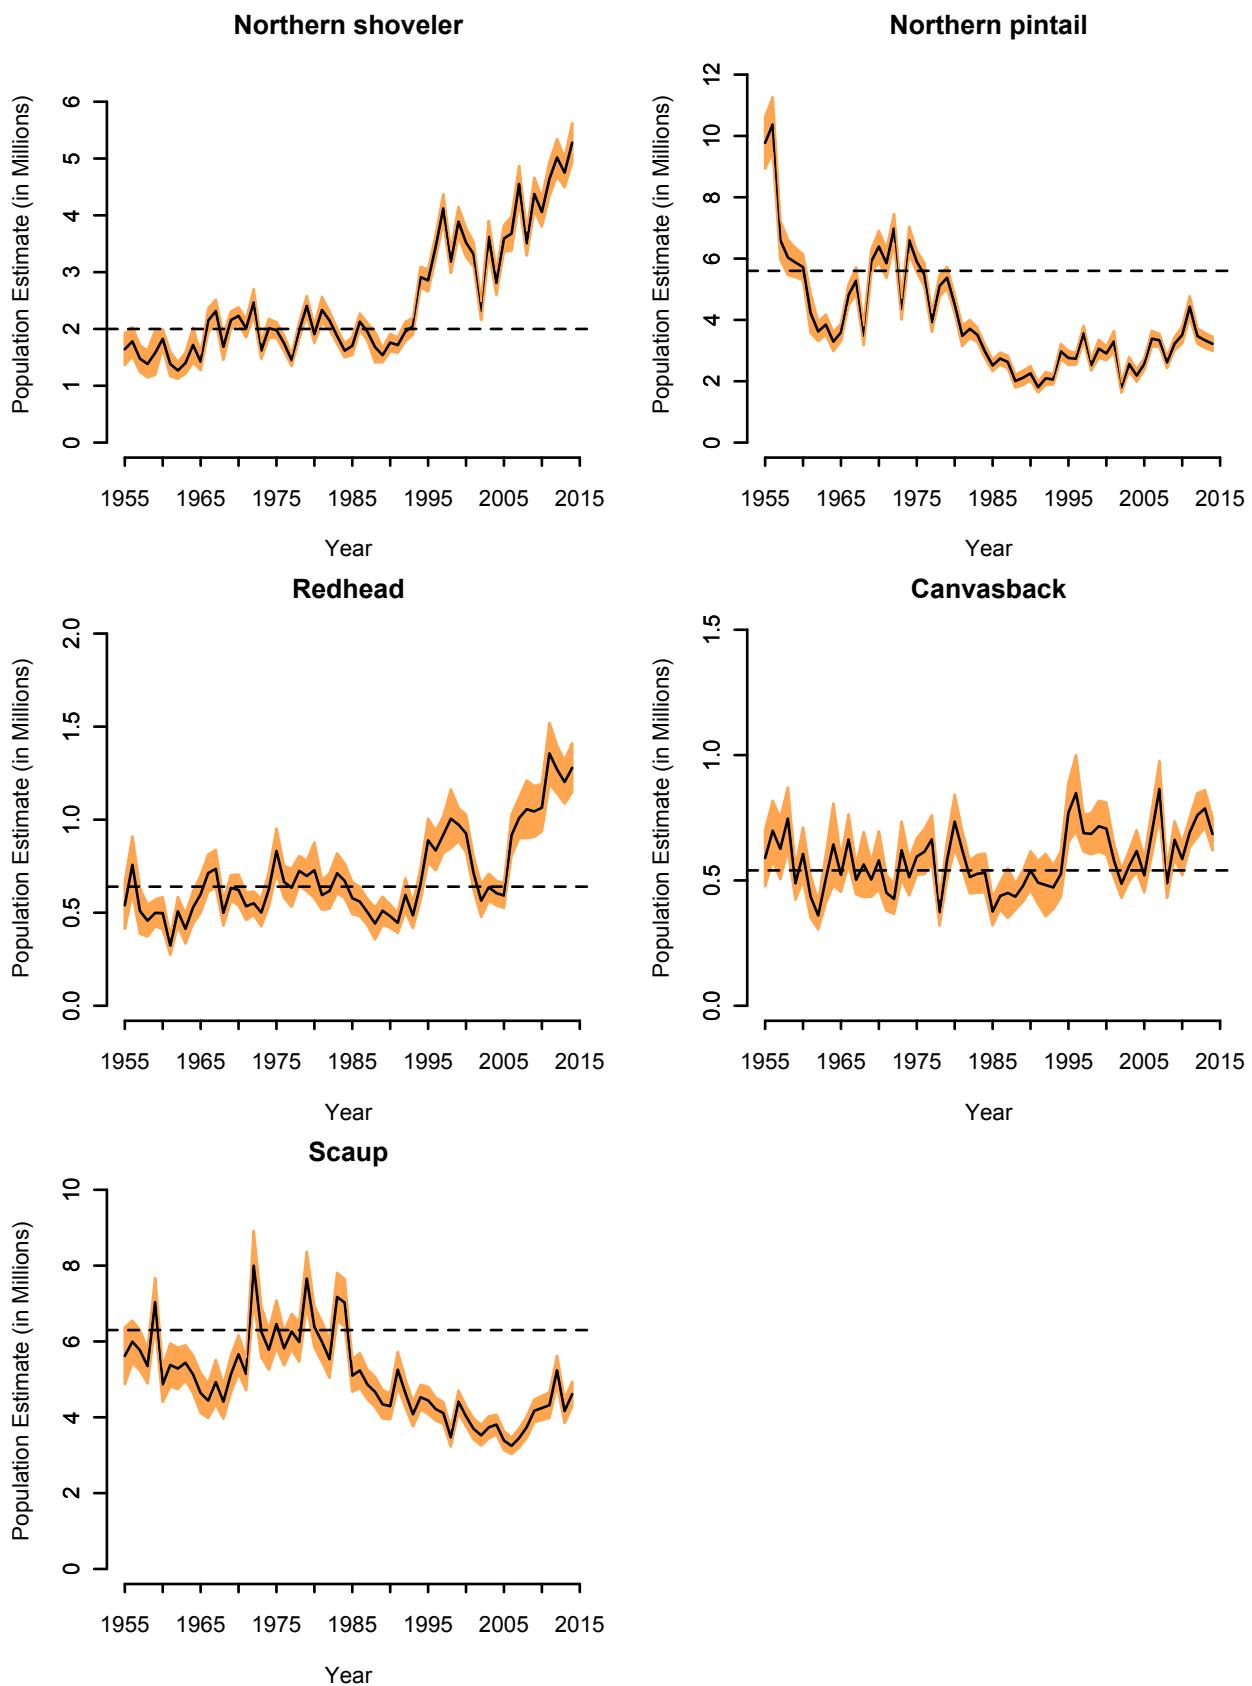

Figure 3. Continued.

**Breeding population estimates (X 1,000) for 10 species of ducks from the traditional survey area, 1955-2014.**

\*Surveys in NV and UT redesigned in 2009 (not comparable to previous years), and redesigned in WA and OR in 2014 (historical data reflect updates).

<sup>a</sup>Pacific Flyway total Cinnamon Teal estimates could be derived from all states except WA, but the majority of the old BW/CIN column is assumed to be CIN, based on recent history.

Most recent 3-yr average:	627,108				265,281	67,417	1,042,736	1,110,153	
Population objective:	300,000				250,000	>35,000			
Stop hunting If below 3-yr avg. threshold of:	95,000				80,000				
Resume hunting if above 3-yr avg. threshold of:	120,000				110,000				

\*Lower Columbia River, Willamette Valley, and Summer Lake, only.

\*\*Population indices are based new methodology, adopted in 2011, and equal (Total Indicated Birds)\*3.35, which is the ratio of fall estimates based on observations of neck-banded birds and spring Yukon-Kuskokwim Delta breeding estimates.

\*\*\*Survey to be conducted in Fall.

\*\*\*\*No White-front survey conducted.

**PACIFIC BRANT** populations as measured during the Pacific Flyway Midwinter Waterfowl Survey (generally January); Izembek index and % young as measured by counts at Izembek Lagoon, AK during the fall prior to the MWS; Regional objectives within an overall objective of 162,000.

<sup>a</sup> In British Columbia, totals for 1984-91 are Christmas Bird Counts, and from 1992-on are from CWS counts.

<sup>b</sup> Includes WHA brant. 3-yr Avg considers most recent 3 years of annual counts.

<sup>c</sup> Izembek index from fall before MWS, includes WHA brant.

**PACIFIC BRANT (Cont.)** populations as measured during the Pacific Flyway Midwinter Waterfowl Survey (generally January); Izembek index and % young as measured by counts at Izembek Lagoon, AK during the fall prior to the MWS; Regional objectives within an overall objective of 162,000.

\* No midwinter waterfowl surveys were conducted in Idaho and Wyoming (Pacific Flyway portion) and the survey was incomplete in Montana and Oregon during 2004.

# No midwinter waterfowl surveys were conducted in Idaho and and the survey was incomplete in Washington and Oregon during 2011-12.

<sup>a</sup>Beginning in 2014, White geese were counted separate from the Mid-Winter Survey in California, which explains the drastic decrease. Please see Fall Goose Surveys in this Data Book.

<sup>b</sup>These do not include Brant counted in Mexico, and beginning in 2014, now include the Izembek counts in Alaska.

<sup>c</sup>Beginning in 2014, Total Geese include Emperor geese.

## PACIFIC FLYWAY MIDWINTER WATERFOWL SURVEY UNITS\*

<sup>a</sup>Starting 2007, the population index changed from a winter mark-recapture method to direct count on Dusky Canada Goose breeding areas.

Number of Tundra Swans counted in the Pacific Flyway during the Mid-Winter waterfowl surveys, 1949-2014.

Year	Arizona	California	Idaho	Montana	Nevada	Oregon	Utah	Washington	Wyoming	Colorado	New Mexico	Annual Index	3-YEAR AVG

<sup>a</sup> No mid-winter waterfowl surveys were conducted in Idaho and Wyoming (Pacific Flyway portion) and the survey was incomplete in Montana during 2004.

<sup>b</sup> Midwinter waterfowl surveys ceased in Idaho after 2010, the survey was incomplete in Montana and Oregon during 2011-13, and swans were not differentiated in OR during 2013-14.

<sup>c</sup> California did not survey the Delta in 1995.

Table 1. Indicated total population indices for cackling Canada, emperor, and white-fronted geese on the Yukon-Kuskokwim Delta, 1985-2014.

## MEMORANDUM

TO: Ken Richkus  
FROM: Todd A. Sanders  
DATE: 13 May 2014  
SUBJECT: Aleutian Canada Goose Abundance

Aleutian Canada geese (*Branta canadensis leucopareia*) were listed as an endangered population in 1967, downgraded to threatened status in 1990, and removed from protection under the endangered species act in 2001. Accurate determination of population status continues to be a priority for management agencies because of the population's past listing as endangered, the species' status as a game bird, and because population expansion has resulted in crop damage complaints.

Two population segments of Aleutian Canada geese are currently recognized based on breeding distribution; a western Aleutian Islands segment comprises birds from the central and western Aleutian Islands, and a Semidi Islands segment comprises birds from the Semidi Islands of the eastern Aleutian Islands. The Semidi Islands segment winters primarily on the northern Oregon coast near Pacific City and consists of about 300 birds and is not the focus of this memo. The western Aleutian Islands segment winters primarily in the San Joaquin Valley and Sacramento River Delta areas of central California (San Joaquin Valley region), and stages in the Humboldt Bay and Crescent City areas on the northern California coast (Humboldt Bay region) in spring before making the transoceanic flight to breeding areas in the western Aleutian Islands.

Breeding population inventories have never been considered a practical means of monitoring population status because of the goose's remote and widely distributed breeding areas. Direct counts in winter were sufficient to monitor their status when the population was small and concentrated in a few local areas (1975–1998). However, as the population has grown and distribution expanded, challenges associated with direct counts have lead managers to indirect methods (mark-resight) of estimating population abundance (1996–present). Annually, a sample of geese are marked with a plastic neckband (each with a highly visible unique alphanumeric code) during November–December in the San Joaquin Valley area and subsequently resighted during January–March in California and Oregon.

An estimate of Aleutian Canada goose abundance from the mark-resight data was derived by expanding an estimate of the abundance of marked geese by the ratio of total per marked geese. A closed robust design model was used for estimation of abundance of marked birds. The model included only sighting data from a primary sample period of 1 January–31 March annually with 2 secondary sample periods of 1 January–14 February and 15 February–31 March in the San Joaquin Valley and Humboldt Bay regions. Estimation of the ratio of total birds to marked birds was determined during a single annual sample period from 15 February–31 March in the Humboldt Bay region (see Sanders, T.A., and R. E. Trost. 2013. Use of capture-recapture models with mark-resight data to estimate abundance of Aleutian cackling geese. *Journal of Wildlife Management* 77:1459–1471.)

The estimated number of Aleutian Canada geese in winter 2014 was 146,854 (SE = 12,956, 95% CI = 121,461–172,247). Abundance of this population has generally increased from 790 in 1975 (Fig. 1, Table 1). Additional survey results are included in Appendix A.

Traditionally survey efforts have focused primarily in the San Joaquin Valley region during 1 January–14 February and primarily in the Humboldt Bay region during 15 February to 31 March consistent with the distribution of these birds and their movement from wintering to spring staging areas. However, observer efforts are not restricted to one region during each survey period. Observers have increasingly reported a broadening distribution of these birds with some remaining in only one region during most or all of the survey periods. Ideally, all primary areas that these birds inhabit would be surveyed during each survey period. Possibly observers could survey for geese opportunistically in the Humboldt Bay region during the first survey period or in the San Joaquin Valley during the second survey period when large numbers of geese can be found. At some point it may become necessary to coordinate survey of both regions during each secondary sampling period.

### Acknowledgements

Many state, federal, and university biologists and volunteers have assisted with counting, marking, and resighting geese, and are too numerous to recognize individually here. Agency coordinators for capturing and marking geese include Melanie Weaver (California Department of Fish and Wildlife) and Dennis Woolington (U.S. Fish and Wildlife Service, San Luis National Wildlife Refuge Complex). Agency coordinators for resighting geese include Melanie Weaver, Dennis Woolington, Eric Nelson and Ken Griggs (U.S. Fish and Wildlife Service Region 8, Humboldt Bay National Wildlife Refuge Complex), Roy Lowe and Shawn Stephensen (U.S. Fish and Wildlife Service Region 1, Oregon Coast National Wildlife Refuge Complex), and Steve Olson (U.S. Fish and Wildlife Service Region 9, Migratory Birds). Additional resight coordination was provided by Brandon Reishus (Oregon Department of Fish and Game), Marie Strassburger (U.S. Fish and Wildlife Service Region 8, Migratory Birds), Joe Sands (U.S. Fish and Wildlife Service Region 1, Migratory Birds), Eric Taylor (U.S. Fish and Wildlife Service Region 7, Migratory Birds), and Heather Renner (U.S. Fish and Wildlife Service Region 7, Alaska Maritime National Wildlife Refuge). Sincere thanks are extended to all agency personnel and volunteers (particularly Denny Brazil) who have contributed to this monitoring effort.

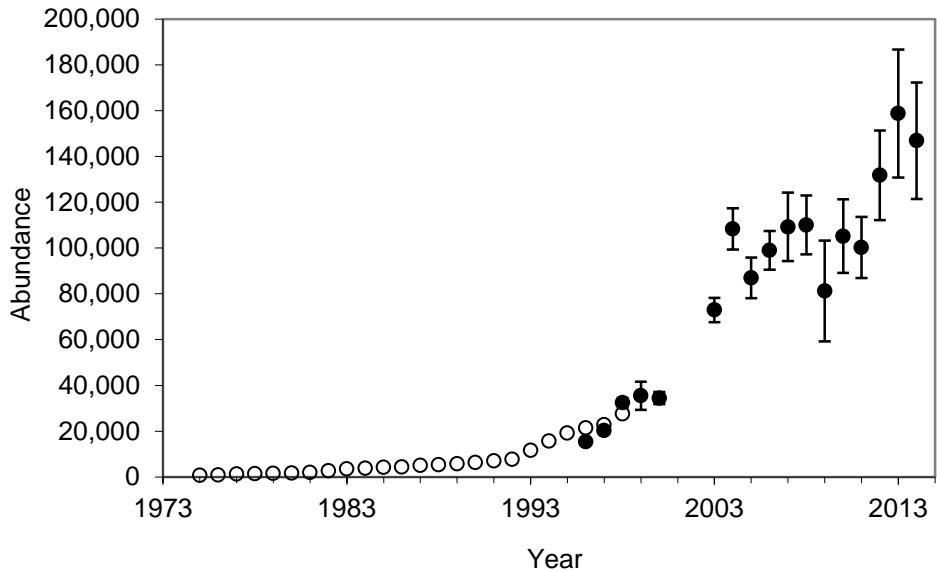

Figure 1. Abundance of Aleutian Canada geese from direct counts (1975–1998, open circles) and estimation using mark-resight methods (1996–2014, closed circles with 95% confidence intervals). The two surveys overlapped for 3 years (1996–1998). There is no estimate for 2001 and 2002 because of insufficient data.

Table 1. Abundance of Aleutian Canada geese from direct counts (1975–1998) and estimation using mark-resight methods (1996–2014, point estimate and 95% confidence intervals). The two surveys overlapped for 3 years (1996–1998). There is no estimate for 2001 and 2002 because of insufficient data.

Table A2. Number (M, with 95% confidence intervals) of marked (neckbanded) Aleutian Canada geese based on a closed robust design model for the San Joaquin Valley and Humboldt Bay regions combined, 1996–2014. U is the number of unique geese observed on all occasions, Un is the number of unique geese observed on all occasions that were marked during the same year, n1 is the number of unique geese observed during occasion 1, n2 is the number of unique geese observed during occasion 2, m2 is the number of unique geese observed during both occasion 1 and occasion 2, M is the estimated number of marked geese in population. There is no estimate for 2001 and 2002 because of insufficient data.

<sup>a</sup> Few or no geese were marked in the year prior to the resight period.

Table A3. Ratio (with 95% confidence intervals) of total Aleutian Canada geese per marked goose in the Humboldt Bay region, 1996–2014.

Year	Flocks	Geese	Marked	Marked per flock	Ratio	SE	Confidence interval	
							Lower	Upper
1996	70	48,646	888	12.7	54.8	2.0	51.0	58.6
1997	62	55,243	867	14.0	63.7	2.3	59.1	68.3
1998	75	53,137	795	10.6	66.8	2.2	62.5	71.1
1999	12	3,613	54	4.5	66.9	5.7	55.8	78.0
2000	102	55,263	870	8.5	63.5	2.3	58.9	68.1
2001	9	7,197	56	6.2	128.5	17.3	94.7	162.4
2002	116	30,324	243	2.1	124.8	14.6	96.2	153.4
2003	485	192,736	1,450	3.0	132.9	4.3	124.5	141.3
2004	750	205,962	1,111	1.5	185.4	7.2	171.2	199.6
